ARIZONA DEPARTMENT OF EDUCATION

HIGH ACADEMIC STANDARDS FOR STUDENTS

State Board Approved June 2010 August 2012 Publication

# High School (9th - 12th) Overview

The high school standards specify the mathematics that all students should study in order to be college and career ready. Additional mathematics that students should learn in fourth credit courses or advanced courses such as calculus, advanced statistics, or discrete mathematics is indicated by (+). All standards without a (+) symbol should be in the common mathematics curriculum for all college and career ready students. Standards with a (+) symbol may also appear in courses intended for all students.

The high school standards are listed in conceptual categories including Number and Quantity, Algebra, Functions, Modeling, Geometry, and Statistics and Probability, and Contemporary Mathematics.

Conceptual categories portray a coherent view of high school mathematics; a student's work with functions, for example, crosses a number of traditional course boundaries, potentially up through and including calculus. Modeling is best interpreted not as a collection of isolated topics but in relation to other standards. Making mathematical models is a Standard for Mathematical Practice, and specific modeling standards appear throughout the high school standards indicated by a star symbol ( $\star$ ).

#### **Number and Quantity**

- The Real Number System (N-RN)
- Quantities (N-Q)
- The Complex Number System (N-CN)
- Vector and Matrix Quantities (N-VM)

#### Algebra

- Seeing Structure in Expressions (A-SSE)
- Arithmetic with Polynomials and Rational Expressions (A-APR)
- Creating Equations (A-CED)
- Reasoning with Equations and Inequalities (A-REI)

#### **Functions**

- Interpreting Functions (F-IF)
- **Building Functions (F-BF)**
- Linear, Quadratic, and Exponential Models (F-LE)
- Trigonometric Functions (F-TF)

#### Geometry

- Congruence (G-CO)
- Similarity, Right Triangles, and Trigonometry (G-SRT)
- Circles (G-C)
- Expressing Geometric Properties with Equations (G-GPE)
- Geometric Measurement and Dimension (G-GMD)
- Modeling with Geometry (G-MG)

#### Modeling

#### Statistics and Probability

- Interpreting Categorical and Quantitative Data (S-ID)
- Making Inferences and Justifying Conclusions (S-IC)
- Conditional Probability and the Rules of Probability (S-CP)
- Using Probability to Make Decisions (S-MD)

#### **Contemporary Mathematics**

• Discrete Mathematics (CM-DM)

## **High School: Number and Quantity Overview**

#### The Real Number System (N-RN)

- Extend the properties of exponents to rational exponents
- Use properties of rational and irrational numbers.

#### Quantities (N-Q)

• Reason quantitatively and use units to solve problems

#### The Complex Number System (N-CN)

- Perform arithmetic operations with complex numbers
- Represent complex numbers and their operations on the complex plane
- Use complex numbers in polynomial identities and equations

#### **Vector and Matrix Quantities (N-VM)**

- Represent and model with vector quantities.
- Perform operations on vectors.
- Perform operations on matrices and use matrices in applications.

#### Mathematical Practices (MP)

- Make sense of problems and persevere in solving them.
- Reason abstractly and quantitatively.
- Construct viable arguments and critique the reasoning of others.
- Model with mathematics.
- Use appropriate tools strategically.
- Attend to precision. 6.
- Look for and make use of structure.
- Look for and express regularity in repeated reasoning.

## High School: Mathematics Standards – Mathematical Practices – Explanations and Examples

#### **Number and Quantity**

#### Numbers and the Number System

During the years from kindergarten to eighth grade, students must repeatedly extend their conception of number. At first, "number" means "counting number": 1, 2, 3.... Soon after that, 0 is used to represent "none" and the whole numbers are formed by the counting numbers together with zero. The next extension is fractions. At first, fractions are barely numbers and tied strongly to pictorial representations. Yet by the time students understand division of fractions, they have a strong concept of fractions as numbers and have connected them, via their decimal representations, with the base-ten system used to represent the whole numbers. During middle school, fractions are augmented by negative fractions to form the rational numbers. In Grade 8, students extend this system once more, augmenting the rational numbers with the irrational numbers to form the real numbers. In high school, students will be exposed to yet another extension of number, when the real numbers are augmented by the imaginary numbers to form the complex numbers.

With each extension of number, the meanings of addition, subtraction, multiplication, and division are extended. In each new number system—integers, rational numbers, real numbers, and complex numbers—the four operations stay the same in two important ways: They have the commutative, associative, and distributive properties and their new meanings are consistent with their previous meanings.

Extending the properties of whole-number exponents leads to new and productive notation. For example, properties of whole-number exponents suggest that  $(5^{1/3})^3$  should be  $5^{(1/3)3} = 5^{1} = 5$  and that  $5^{1/3}$  should be the cube root of 5.

Calculators, spreadsheets, and computer algebra systems can provide ways for students to become better acquainted with these new number systems and their notation. They can be used to generate data for numerical experiments, to help understand the workings of matrix, vector, and complex number algebra, and to experiment with non-integer exponents.

#### Quantities

In real world problems, the answers are usually not numbers but quantities: numbers with units, which involves measurement. In their work in measurement up through Grade 8, students primarily measure commonly used attributes such as length, area, and volume. In high school, students encounter a wider variety of units in modeling, e.g., acceleration, currency conversions, derived quantities such as person-hours and heating degree days, social science rates such as per-capita income, and rates in everyday life such as points scored per game or batting averages. They also encounter novel situations in which they themselves must conceive the attributes of interest. For example, to find a good measure of overall highway safety, they might propose measures such as fatalities per year, fatalities per year per driver, or fatalities per vehicle-mile traveled. Such a conceptual process is sometimes called quantification. Quantification is important for science, as when surface area suddenly "stands out" as an important variable in evaporation. Quantification is also important for companies, which must conceptualize relevant attributes and create or choose suitable measures for them.

Number and Quantity: Vect	Number and Quantity: Vector and Matrix Quantities (N-VM)			
Represent and model with vector quantities				
Standards Students are expected to:	<u>Label</u>	<u>Mathematical Practices</u>	Explanations and Examples	
HS.N-VM.1. Recognize vector quantities as having both magnitude and direction. Represent vector quantities by directed line segments, and use appropriate symbols for vectors and their magnitudes (e.g., v,  v ,   v  , v).	+	HS.MP.4. Model with mathematics.		
HS.N-VM.2. Find the components of a vector by subtracting the coordinates of an initial point from the coordinates of a terminal point.	+	HS.MP.2. Reason abstractly and quantitatively.		
HS.N-VM.3. Solve problems involving velocity and other quantities that can be represented by vectors.  Connections: 11-12.RST.9; SCHS-S5C2-01; SCHS-S5C2-06; 11-12.WHST.2d	+	HS.MP.1. Make sense of problems and persevere in solving them.  HS.MP.2. Reason abstractly and quantitatively.  HS.MP.4. Model with mathematics.  HS.MP.5. Use appropriate tools strategically.  HS.MP.6. Attend to precision.	<ul> <li>A motorboat traveling from one shore to the other at a rate of 5 m/s east encounters a current flowing at a rate of 3.5 m/s north.</li> <li>What is the resultant velocity?</li> <li>If the width of the river is 60 meters wide, then how much time does it take the boat to travel to the opposite shore?</li> <li>What distance downstream does the boat reach the opposite shore?</li> <li>A ship sails 12 hours at a speed of 15 knots (nautical miles per hour) at a heading of 68° north of east. It then turns to a heading of 75° north of east and travels for 5 hours at 8 knots. Find its position north and east of its starting point.         (For this problem, assume the earth is flat.)     </li> <li>The solution may require an explanation, orally or in written form, that includes understanding of velocity and other relevant quantities.</li> </ul>	

## Number and Quantity: Vector and Matrix Quantities (N-VM)

Perform operations on vectors				
<u>Standards</u>	<u>Label</u>	Mathematical Practices	Explanations and Examples	
Students are expected to:				
<b>HS.N-VM.4.</b> Add and subtract vectors.	+	HS.MP.2. Reason abstractly and quantitatively.	Addition of vectors is used to determine the resultant of two given vectors. This can be done by lining up the vectors end to end, adding the components, or using the parallelogram rule. Students may use applets to help them visualize operations of vectors given in rectangular or polar form.	
a. Add vectors end-to-end, component-wise, and by the parallelogram rule. Understand that the magnitude of a sum of two vectors is typically not the sum of the magnitudes.	+	HS.MP.4. Model with mathematics.  HS.MP.5. Use appropriate tools strategically.	(a, b) (a+c, b+d)	
b. Given two vectors in magnitude and direction form, determine the magnitude and direction of their sum.	+		<ul> <li>(c, d)</li> <li>Example:</li> <li>Given two vectors u and v, can the magnitude of the resultant be found by adding the magnitude of each vector? Use an example to illustrate your explanation.</li> </ul>	
c. Understand vector subtraction $v - w$ as $v + (-w)$ , where $-w$ is the additive inverse of $w$ , with the same magnitude as $w$ and pointing in the opposite direction. Represent vector subtraction graphically by connecting the tips in the appropriate order, and perform vector subtraction: FTHS-S6C1-03	+		<ul> <li>If u = \langle - 2, -8 \rangle and v = \langle 2, 8 \rangle , find u + v, u + (-v), and u - v. Explain the relationship between u + (-v) and u - v in terms of the vector components.</li> <li>A plane is flying due east at an average speed of 500 miles per hour. There is a crosswind from the south at 60 miles per hour. What is the magnitude and direction of the resultant?</li> </ul>	
subtraction component-wise.  Connection: <i>ETHS-S6C1-03</i>				

Number and Quantity: Vect	or and N	Matrix Quantities (N-VM)	
Perform operations on vect	t <mark>ors</mark> cont	inued	
<u>Standards</u> Students are expected to:	<u>Label</u>	<u>Mathematical Practices</u>	Explanations and Examples
<b>HS.N-VM.5.</b> Multiply a vector by a scalar.  a. Represent scalar	+	HS.MP.2. Reason abstractly and quantitatively.  HS.MP.4. Model with	The result of multiplying a vector $v$ by a positive scalar $c$ is a vector in the same direction as $v$ with a magnitude of $cv$ . If $c$ is negative, then the direction of $v$ is reversed by scalar multiplication. Students will represent scalar multiplication graphically and component-wise. Students may use applets to help them visualize operations of vectors given in rectangular or polar form.
multiplication graphically by scaling vectors and possibly reversing their direction; perform scalar multiplication component-wise, e.g., as $c(v_x, v_y) = (cv_x, cv_y)$ .		mathematics.  HS.MP.5. Use appropriate tools strategically.	Example:  • Given $u = \langle 2, 4 \rangle$ , write the components and draw the vectors for $u$ , $2u$ , $1/2u$ , and $-u$ . How are the vectors related?
b. Compute the magnitude of a scalar multiple $cv$ using $  cv   =  c v$ . Compute the direction of $cv$ knowing that when $ c v \neq 0$ , the direction of $cv$ is either along $v$ (for $c > 0$ ) or against $v$ (for $c < 0$ ).	+		
Connection: ETHS-S6C1-03			

Number and Quantity: Vector and Matrix Quantities (N-VM)					
	Perform operations on matrices and use matrices in applications				
Standards Students are expected to:  Label	Mathematical Practices	Explanations and Examples			
HS.N-VM.6. Use matrices to represent and manipulate data, e.g., to represent payoffs or incidence relationships in a network.  Connections: 9-10.RST.7; 9-10.WHST.2f; 11-12.RST.9; 11-12.WHST.2e; ETHS-S6C2-03;	HS.MP.2. Reason abstractly and quantitatively.  HS.MP.4. Model with mathematics.  HS.MP.5. Use appropriate tools strategically.	Students may use graphing calculators and spreadsheets to create and perform operations on matrices.  The adjacency matrix of a simple graph is a matrix with rows and columns labeled by graph vertices, with a 1 or a 0 in position (v, v,) according to whether v, and v, are adjacent or not. A "1" indicates that there is a connection between the two vertices, and a "0" indicates that there is no connection.  Example:  • Write an inventory matrix for the following situation. A teacher is buying supplies for two art classes. For class 1, the teacher buys 24 tubes of paint, 12 brushes, and 17 canvases. For class 2, the teacher buys 20 tubes of paint, 14 brushes and 15 canvases. Next year, she has 3 times as many students in each class. What affect does this have on the amount of supplies?  Solution:  Year 1  P B C  Class 1

HS.N-VM.8. Add, subtract, and multiply matrices of appropriate dimensions.  Connections: 9-10.RST.3; ETHS-S6C2-03	9-10	HS.MP.2. Reason abstractly and quantitatively.  HS.MP.4. Model with mathematics.  HS.MP.5. Use appropriate tools strategically.	Students may use graphing calculators and spreadsheets to create and perform operations on matrices. <b>Example:</b> • Find $2A - B + C$ and $A \bullet B$ given Matrices $A$ , $B$ and $C$ below.  Matrix $A$ Matrix $B$ Matrix $C$ $\begin{bmatrix} -7 & 19 & 15 \\ 41 & -63 & 20 \\ 2 & 0 & -8 \end{bmatrix}$ $\begin{bmatrix} 23 & 18 & 55 \\ -18 & -47 & 11 \\ 39 & -6 & -8 \end{bmatrix}$ $\begin{bmatrix} -4 & 7 & 12 \\ 51 & 9 & 80 \\ 13 & 72 & 8 \end{bmatrix}$
HS.N-VM.9. Understand that, unlike multiplication of numbers, matrix multiplication for square matrices is not a commutative operation, but still satisfies the associative and distributive properties.  Connections: ETHS-S6C2-03; 9-10.WHST.1e	9-10	HS.MP.2. Reason abstractly and quantitatively.  HS.MP.6. Attend to precision.	Students may use graphing calculators and spreadsheets to create and perform operations on matrices. <b>Example:</b> • Given $A = \begin{bmatrix} -1 & 3 \\ 4 & 6 \end{bmatrix}$ and $B = \begin{bmatrix} 2 & 3 \\ -4 & 5 \end{bmatrix}$ and $C = \begin{bmatrix} 6 & -2 \\ 9 & 7 \end{bmatrix}$ ;  determine if the following statements are true:  • $AB = BA$ • $(AB)C = A(BC)$
HS.N-VM.10. Understand that the zero and identity matrices play a role in matrix addition and multiplication similar to the role of 0 and 1 in the real numbers. The determinant of a square matrix is nonzero if and only if the matrix has a multiplicative inverse.	*	HS.MP.2. Reason abstractly and quantitatively. HS.MP.6. Attend to precision.	

Number and Quantity: Vect			
Perform operations on ma	trices an	d use matrices in applica	tions continued
Standards Students are expected to:	<u>Label</u>	<u>Mathematical Practices</u>	Explanations and Examples
HS.N-VM.11. Multiply a vector (regarded as a matrix with one column) by a matrix of suitable dimensions to produce another vector. Work with matrices as transformations of vectors.  Connections: ETHS-S6C1-03; 11-12.WHST.1a	+	HS.MP.4. Model with mathematics.  HS.MP.5. Use appropriate tools strategically.	A matrix is a two dimensional array with rows and columns; a vector is a one dimensional array that is either one row or one column of the matrix.  Students will use matrices to transform geometric objects in the coordinate plane. Students may demonstrate transformations using dynamic geometry programs or applets. They will explain the relationship between the ordered pair representation of a vector and its graphical representation.
<b>HS.N-VM.12.</b> Work with $2 \times 2$ matrices as transformations of the plane, and interpret the absolute value of the determinant in terms of area. Connection: <i>ETHS-S6C1-03</i>	+	HS.MP.4. Model with mathematics.  HS.MP.5. Use appropriate tools strategically.	Students should be able to utilize matrix multiplication to perform reflections, rotations and dilations, and find the area of a parallelogram. Students may demonstrate these relationships using dynamic geometry programs or applets.

## **High School: Algebra Overview**

#### Seeing Structure in Expressions (A-SSE)

- Interpret the structure of expressions
- Write expressions in equivalent forms to solve problems

#### Arithmetic with Polynomials and Rational Expressions (A-APR)

- Perform arithmetic operations on polynomials
- Understand the relationship between zeros and factors of polynomials
- Use polynomial identities to solve problems
- Rewrite rational expressions

#### **Creating Equations (A-CED)**

Create equations that describe numbers or relationships

#### Reasoning with Equations and Inequalities (A-REI)

- Understand solving equations as a process of reasoning and explain the reasoning
- Solve equations and inequalities in one variable
- Solve systems of equations
- Represent and solve equations and inequalities graphically

#### Mathematical Practices (MP)

- 1. Make sense of problems and persevere in solving them.
- Reason abstractly and quantitatively.
- Construct viable arguments and critique the reasoning of others.
- Model with mathematics.
- Use appropriate tools strategically.
- Attend to precision. 6.
- Look for and make use of structure.
- Look for and express regularity in repeated reasoning.

## High School: Mathematics Standards – Mathematical Practices – Explanations and Examples

## **Algebra**

#### **Expressions**

An expression is a record of a computation with numbers, symbols that represent numbers, arithmetic operations, exponentiation, and, at more advanced levels, the operation of evaluating a function. Conventions about the use of parentheses and the order of operations assure that each expression is unambiguous. Creating an expression that describes a computation involving a general quantity requires the ability to express the computation in general terms, abstracting from specific instances.

Reading an expression with comprehension involves analysis of its underlying structure. This may suggest a different but equivalent way of writing the expression that exhibits some different aspect of its meaning. For example, p + 0.05p can be interpreted as the addition of a 5% tax to a price p. Rewriting p + 0.05p as 1.05p shows that adding a tax is the same as multiplying the price by a constant factor.

Algebraic manipulations are governed by the properties of operations and exponents, and the conventions of algebraic notation. At times, an expression is the result of applying operations to simpler expressions. For example, p + 0.05p is the sum of the simpler expressions p and 0.05p. Viewing an expression as the result of operation on simpler expressions can sometimes clarify its underlying structure.

A spreadsheet or a computer algebra system (CAS) can be used to experiment with algebraic expressions, perform complicated algebraic manipulations, and understand how algebraic manipulations behave.

#### **Equations and Inequalities**

An equation is a statement of equality between two expressions, often viewed as a question asking for which values of the variables the expressions on either side are in fact egual. These values are the solutions to the equation. An identity, in contrast, is true for all values of the variables; identities are often developed by rewriting an expression in an equivalent form.

The solutions of an equation in one variable form a set of numbers; the solutions of an equation in two variables form a set of ordered pairs of numbers, which can be plotted in the coordinate plane. Two or more equations and/or inequalities form a system. A solution for such a system must satisfy every equation and inequality in the system.

An equation can often be solved by successively deducing from it one or more simpler equations. For example, one can add the same constant to both sides without changing the solutions, but squaring both sides might lead to extraneous solutions. Strategic competence in solving includes looking ahead for productive manipulations and anticipating the nature and number of solutions.

Some equations have no solutions in a given number system, but have a solution in a larger system. For example, the solution of x + 1 = 0 is an integer, not a whole number; the solution of 2x + 1 = 0 is a rational number, not an integer; the solutions of  $x^2 - 2 = 0$  are real numbers, not rational numbers; and the solutions of  $x^2 + 2 = 0$  are complex numbers, not real numbers.

The same solution techniques used to solve equations can be used to rearrange formulas. For example, the formula for the area of a trapezoid,  $A = ((b_1+b_2)/2)h$ , can be solved for h using the same deductive process.

Inequalities can be solved by reasoning about the properties of inequality. Many, but not all, of the properties of equality continue to hold for inequalities and can be useful in solving them.

#### **Connections to Functions and Modeling**

Expressions can define functions, and equivalent expressions define the same function. Asking when two functions have the same value for the same input leads to an equation; graphing the two functions allows for finding approximate solutions of the equation. Converting a verbal description to an equation, inequality, or system of these is an essential skill in modeling.

Algebra: Seeing	Structure in l	Expressions (	(A-SSE)
-----------------	----------------	---------------	---------

Algebra: Seeing Structure in	i Expies	Siulis (A-33E)	
Interpret the structure of e	xpressio	ns	
Standards Students are expected to:	<u>Label</u>	Mathematical Practices	Explanations and Examples
<b>HS.A-SSE.1.</b> Interpret expressions that represent a quantity in terms of its context.	9-10 ★	HS.MP.1. Make sense of problems and persevere in solving them.	Students should understand the vocabulary for the parts that make up the whole expression and be able to identify those parts and interpret their meaning in terms of a context.
a. Interpret parts of an expression, such as terms, factors, and coefficients.  Connection: 9-10.RST.4	9-10	HS.MP.2. Reason abstractly and quantitatively.  HS.MP.4. Model with mathematics.	
b. Interpret complicated expressions by viewing one or more of their parts as a single entity. For example, interpret $P(1+r)^n$ as the product of $P$ and a factor not depending on $P$ .	9-10 ★	HS.MP.7. Look for and make use of structure.	
<b>HS.A-SSE.2.</b> Use the structure of an expression to identify ways to rewrite it. For example, see $x^4 - y^4$ as $(x^2)^2 - (y^2)^2$ , thus recognizing it as a difference of squares that can be factored as $(x^2 - y^2)(x^2 + y^2)$ .	9-10	HS.MP.2. Reason abstractly and quantitatively.  HS.MP.7. Look for and make use of structure.	Students should extract the greatest common factor (whether a constant, a variable, or a combination of each). If the remaining expression is quadratic, students should factor the expression further. <b>Example:</b> • Factor $x^3 - 2x^2 - 35x$

The distance in miles (d) that her car travels as a function of time in hours (t) since Suzette's car passed is given by d = 3500t².</li> </ul> </li> <li>Write and solve a system of equations to determine how long it takes for Andrea to catch up with Suzette.</li> </ul>
<b>HS.A-REI.8.</b> Represent a system of linear equations as a single matrix equation in a vector variable.	*		• Write the system $\begin{cases} -b+2c=4\\ a+b-c=0 \text{ as a matrix equation.} \\ 2a+3c=11 \end{cases}$ Identify the coefficient matrix, the variable matrix, and the constant matrix.

## Algebra: Reasoning with Equations and Inequalities ★ (A-REI)

#### Solve systems of equations continued

**HS.A-REI.9.** Find the inverse of a matrix if it exists, and use it to solve systems of linear equations (using technology for matrices of dimension  $3 \times 3$  or greater).

Connection: ETHS-S6C2-03

HS.MP.5. Use appropriate tools strategically.

> HS.MP.6. Attend to precision.

HS.MP.7. Look for and make use of structure. Students will perform multiplication, addition, subtraction, and scalar multiplication of matrices. They will use the inverse of a matrix to solve a matrix equation. Students may use graphing calculators, programs, or applets to model and find solutions for systems of equations.

#### Example:

Solve the system of equations by converting to a matrix equation and using the inverse of the coefficient matrix.

$$\begin{cases} 5x + 2y = 4 \\ 3x + 2y = 0 \end{cases}$$

Solution:

Matrix 
$$A = \begin{bmatrix} 5 & 2 \\ 3 & 2 \end{bmatrix}$$

Matrix 
$$X = \begin{bmatrix} x \\ y \end{bmatrix}$$

Matrix 
$$B = \begin{bmatrix} 4 \\ 0 \end{bmatrix}$$

Matrix 
$$A^{-1} = \begin{bmatrix} \frac{1}{2} & -\frac{1}{2} \\ \frac{3}{4} & \frac{5}{4} \end{bmatrix}$$

$$X = A^{-1}B$$

$$\begin{bmatrix} x \\ y \end{bmatrix} = \begin{bmatrix} \frac{1}{2} & -\frac{1}{2} \\ -\frac{3}{4} & \frac{5}{4} \end{bmatrix} \begin{bmatrix} 4 \\ 0 \end{bmatrix} = \begin{bmatrix} 2 \\ -3 \end{bmatrix}$$

# **High School: Function Overview**

#### Interpreting Functions (F-IF)

- Understand the concept of a function and use function notation
- Interpret functions that arise in applications in terms of the context
- Analyze functions using different representations

#### **Building Functions (F-BF)**

- Build a function that models a relationship between two quantities
- Build new functions from existing functions

#### Linear, Quadratic, and Exponential Models (F-LE)

- Construct and compare linear, quadratic, and exponential models and solve problems
- Interpret expressions for functions in terms of the situation they model

#### **Trigonometric Functions (F-TF)**

- Extend the domain of trigonometric functions using the unit circle
- Model periodic phenomena with trigonometric functions
- Prove and apply trigonometric identities

#### Mathematical Practices (MP)

- Make sense of problems and persevere in solving them.
- Reason abstractly and quantitatively.
- Construct viable arguments and critique the reasoning of others.
- Model with mathematics.
- Use appropriate tools strategically.
- Attend to precision. 6.
- Look for and make use of structure.
- Look for and express regularity in repeated reasoning.

# High School: Mathematics Standards – Mathematical Practices – Explanations and Examples

#### **Functions**

Functions describe situations where one quantity determines another. For example, the return on \$10,000 invested at an annualized percentage rate of 4.25% is a function of the length of time the money is invested. Because we continually make theories about dependencies between quantities in nature and society, functions are important tools in the construction of mathematical models.

In school mathematics, functions usually have numerical inputs and outputs and are often defined by an algebraic expression. For example, the time in hours it takes for a car to drive 100 miles is a function of the car's speed in miles per hour, v; the rule T(v) = 100/v expresses this relationship algebraically and defines a function whose name is T.

The set of inputs to a function is called its domain. We often infer the domain to be all inputs for which the expression defining a function has a value, or for which the function makes sense in a given context.

A function can be described in various ways, such as by a graph (e.g., the trace of a seismograph); by a verbal rule, as in, "I'll give you a state, you give me the capital city;" by an algebraic expression like f(x) = a + bx; or by a recursive rule. The graph of a function is often a useful way of visualizing the relationship of the function models, and manipulating a mathematical expression for a function can throw light on the function's properties.

Functions presented as expressions can model many important phenomena. Two important families of functions characterized by laws of growth are linear functions, which grow at a constant rate, and exponential functions, which grow at a constant percent rate. Linear functions with a constant term of zero describe proportional relationships.

A graphing utility or a computer algebra system can be used to experiment with properties of these functions and their graphs and to build computational models of functions, including recursively defined functions.

#### Connections to Expressions, Equations, Modeling, and Coordinates

Determining an output value for a particular input involves evaluating an expression; finding inputs that yield a given output involves solving an equation. Questions about when two functions have the same value for the same input lead to equations, whose solutions can be visualized from the intersection of their graphs. Because functions describe relationships between quantities, they are frequently used in modeling. Sometimes functions are defined by a recursive process, which can be displayed effectively using a spreadsheet or other technology.

Understand the concept of	Understand the concept of a function and use of function notation			
<u>Standards</u>	<u>Label</u>	Mathematical Practices	Explanations and Examples	
Students are expected to:				
<b>HS.F-IF.1.</b> Understand that a function from one set (called the domain) to another set (called the range) assigns to each element of the domain exactly one element of the range. If $f$ is a function and $x$ is an element of its domain, then $f(x)$ denotes the output of $f$ corresponding to the input $f$ . The graph of $f$ is the graph of the equation $f$	9-10	HS.MP.2. Reason abstractly and quantitatively.	The domain of a function given by an algebraic expression, unless otherwise specified, is the largest possible domain.

### **Modeling**

Modeling links classroom mathematics and statistics to everyday life, work, and decision-making. Modeling is the process of choosing and using appropriate mathematics and statistics to analyze empirical situations, to understand them better, and to improve decisions. Quantities and their relationships in physical, economic, public policy, social, and everyday situations can be modeled using mathematical and statistical methods. When making mathematical models, technology is valuable for varying assumptions, exploring consequences, and comparing predictions with data.

A model can be very simple, such as writing total cost as a product of unit price and number bought, or using a geometric shape to describe a physical object like a coin. Even such simple models involve making choices. It is up to us whether to model a coin as a three-dimensional cylinder, or whether a two-dimensional disk works well enough for our purposes. Other situations—modeling a delivery route, a production schedule, or a comparison of loan amortizations—need more elaborate models that use other tools from the mathematical sciences. Real-world situations are not organized and labeled for analysis; formulating tractable models, representing such models, and analyzing them is appropriately a creative process. Like every such process, this depends on acquired expertise as well as creativity.

Some examples of such situations might include:

- Estimating how much water and food is needed for emergency relief in a devastated city of 3 million people, and how it might be distributed.
- Planning a table tennis tournament for 7 players at a club with 4 tables, where each player plays against each other player.
- Designing the layout of the stalls in a school fair so as to raise as much money as possible.
- Analyzing stopping distance for a car.
- Modeling savings account balance, bacterial colony growth, or investment growth.
- Engaging in critical path analysis, e.g., applied to turnaround of an aircraft at an airport.
- Analyzing risk in situations such as extreme sports, pandemics, and terrorism.
- Relating population statistics to individual predictions.

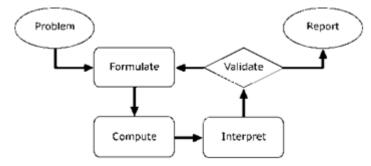

In situations like these, the models devised depend on a number of factors: How precise an answer do we want or need? What aspects of the situation do we most need to understand, control, or optimize? What resources of time and tools do we have? The range of models that we can create and analyze is also constrained by the limitations of our mathematical, statistical, and technical skills, and our ability to recognize significant variables and relationships among them. Diagrams of various kinds, spreadsheets and other technology, and algebra are powerful tools for understanding and solving problems drawn from different types of real-world situations.

One of the insights provided by mathematical modeling is that essentially the same mathematical or statistical structure can sometimes model seemingly different situations. Models can also shed light on the mathematical structures themselves, for example, as when a model of bacterial growth makes more vivid the explosive growth of the exponential function.

# **High School: Modeling (continued)**

The basic modeling cycle is summarized in the diagram. It involves (1) identifying variables in the situation and selecting those that represent essential features, (2) formulating a model by creating and selecting geometric, graphical, tabular, algebraic, or statistical representations that describe relationships between the variables, (3) analyzing and performing operations on these relationships to draw conclusions, (4) interpreting the results of the mathematics in terms of the original situation, (5) validating the conclusions by comparing them with the situation, and then either improving the model or, if it is acceptable, (6) reporting on the conclusions and the reasoning behind them. Choices, assumptions, and approximations are present throughout this cycle.

In descriptive modeling, a model simply describes the phenomena or summarizes them in a compact form. Graphs of observations are a familiar descriptive model—for example, graphs of global temperature and atmospheric  $CO_2$  over time.

Analytic modeling seeks to explain data on the basis of deeper theoretical ideas, albeit with parameters which are empirically based; for example, exponential growth of bacterial colonies (until cut-off mechanisms such as pollution or starvation intervene) follows from a constant reproduction rate. Functions are an important tool for analyzing such problems.

Graphing utilities, spreadsheets, computer algebra systems, and dynamic geometry software are powerful tools that can be used to model purely mathematical phenomena (e.g., the behavior of polynomials) as well as physical phenomena.

#### **Modeling Standards**

Modeling is best interpreted not as a collection of isolated topics but rather in relation to other standards. Making mathematical models is a Standard for Mathematical Practice, and specific modeling standards appear throughout the high school standards indicated by a star symbol (\*).

# **High School: Geometry Overview**

#### Congruence (G-CO)

- Experiment with transformations in the plane
- Understand congruence in terms of rigid motions
- Prove geometric theorems
- Make geometric constructions

#### Similarity, Right Triangles, and Trigonometry (G-SRT)

- Understand similarity in terms of similarity transformations
- Prove theorems involving similarity
- Define trigonometric ratios and solve problems involving right triangles
- Apply trigonometry to general triangles

#### Circles (G-C)

- Understand and apply theorems about circles
- Find arc lengths and areas of sectors of circles

#### **Expressing Geometric Properties with Equations (G-GPE)**

- Translate between the geometric description and the equation for a conic section
- Use coordinates to prove simple geometric theorems algebraically

### Geometric Measurement and Dimension (G-GMD)

- Explain volume formulas and use them to solve problems
- Visualize relationships between two-dimensional and three-dimensional objects

### Modeling with Geometry (G-MG)

Apply geometric concepts in modeling situations

#### Mathematical Practices (MP)

- 1. Make sense of problems and persevere in solving them.
- Reason abstractly and quantitatively.
- Construct viable arguments and critique the reasoning of others.
- Model with mathematics.
- Use appropriate tools strategically.
- Attend to precision. 6.
- Look for and make use of structure.
- Look for and express regularity in repeated reasoning.

# High School: Mathematics Standards – Mathematical Practices – Explanations and Examples

### **Geometry**

An understanding of the attributes and relationships of geometric objects can be applied in diverse contexts—interpreting a schematic drawing, estimating the amount of wood needed to frame a sloping roof, rendering computer graphics, or designing a sewing pattern for the most efficient use of material.

Although there are many types of geometry, school mathematics is devoted primarily to plane Euclidean geometry, studied both synthetically (without coordinates) and analytically (with coordinates). Euclidean geometry is characterized most importantly by the Parallel Postulate, that through a point not on a given line there is exactly one parallel line. (Spherical geometry, in contrast, has no parallel lines.)

During high school, students begin to formalize their geometry experiences from elementary and middle school, using more precise definitions and developing careful proofs. Later in college some students develop Euclidean and other geometries carefully from a small set of axioms.

The concepts of congruence, similarity, and symmetry can be understood from the perspective of geometric transformation. Fundamental are the rigid motions: translations, rotations, reflections, and combinations of these, all of which are here assumed to preserve distance and angles (and therefore shapes generally). Reflections and rotations each explain a particular type of symmetry, and the symmetries of an object offer insight into its attributes—as when the reflective symmetry of an isosceles triangle assures that its base angles are congruent.

In the approach taken here, two geometric figures are defined to be congruent if there is a sequence of rigid motions that carries one onto the other. This is the principle of superposition. For triangles, congruence means the equality of all corresponding pairs of sides and all corresponding pairs of angles. During the middle grades, through experiences drawing triangles from given conditions, students notice ways to specify enough measures in a triangle to ensure that all triangles drawn with those measures are congruent. Once these triangle congruence criteria (ASA, SAS, and SSS) are established using rigid motions, they can be used to prove theorems about triangles, quadrilaterals, and other geometric figures.

Similarity transformations (rigid motions followed by dilations) define similarity in the same way that rigid motions define congruence, thereby formalizing the similarity ideas of "same shape" and "scale factor" developed in the middle grades. These transformations lead to the criterion for triangle similarity that two pairs of corresponding angles are congruent.

The definitions of sine, cosine, and tangent for acute angles are founded on right triangles and similarity, and, with the Pythagorean Theorem, are fundamental in many realworld and theoretical situations. The Pythagorean Theorem is generalized to non-right triangles by the Law of Cosines. Together, the Laws of Sines and Cosines embody the triangle congruence criteria for the cases where three pieces of information suffice to completely solve a triangle. Furthermore, these laws yield two possible solutions in the ambiguous case, illustrating that Side-Side-Angle is not a congruence criterion.

Analytic geometry connects algebra and geometry, resulting in powerful methods of analysis and problem solving. Just as the number line associates numbers with locations in one dimension, a pair of perpendicular axes associates pairs of numbers with locations in two dimensions. This correspondence between numerical coordinates and geometric points allows methods from algebra to be applied to geometry and vice versa. The solution set of an equation becomes a geometric curve, making visualization a tool for doing and understanding algebra. Geometric shapes can be described by equations, making algebraic manipulation into a tool for geometric understanding, modeling, and proof. Geometric transformations of the graphs of equations correspond to algebraic changes in their equations.

Dynamic geometry environments provide students with experimental and modeling tools that allow them to investigate geometric phenomena in much the same way as computer algebra systems allow them to experiment with algebraic phenomena.

# **High School: Geometry (continued)**

#### **Connections to Equations**

The correspondence between numerical coordinates and geometric points allows methods from algebra to be applied to geometry and vice versa. The solution set of an equation becomes a geometric curve, making visualization a tool for doing and understanding algebra. Geometric shapes can be described by equations, making algebraic manipulation into a tool for geometric understanding, modeling, and proof.

<b>Geometry: Similarity, Right</b>	Triangl	es, and Trigonometry (G-	SRT)
Understand similarity in te	rms of s	milarity transformations	
Standards Students are expected to:	<u>Label</u>	<u>Mathematical Practices</u>	Explanations and Examples
HS.G-SRT.1. Verify experimentally the properties of dilations given by a center and a scale factor:  Connections: ETHS-S1C2-01; 9-10.WHST.1e	9-10	HS.MP.2. Reason abstractly and quantitatively.  HS.MP.5. Use appropriate tools strategically.	Dilation is a transformation that moves each point along the ray through the point emanating from a fixed center, and multiplies distances from the center by a common scale factor.  Students may use geometric simulation software to model transformations. Students may observe patterns and verify experimentally the properties of dilations.
a. Dilation takes a line not passing through the center of the dilation to a parallel line, and leaves a line passing through the center unchanged.	9-10		
b. The dilation of a line segment is longer or shorter in the ratio given by the scale factor.	9-10		
HS.G-SRT.2. Given two figures, use the definition of similarity in terms of similarity transformations to decide if they are similar; explain using similarity transformations the meaning of similarity for triangles as the equality of all corresponding pairs of angles and the proportionality of all corresponding pairs of sides.  Connections: ETHS-S1C2-01; 9-10.RST.4; 9-10.WHST.1c	9-10	HS.MP.3. Construct viable arguments and critique the reasoning of others.  HS.MP.5. Use appropriate tools strategically.  HS.MP.7. Look for and make use of structure.	A similarity transformation is a rigid motion followed by dilation.  Students may use geometric simulation software to model transformations and demonstrate a sequence of transformations to show congruence or similarity of figures.

Geometry: Similarity, Right Triangles, and Trigonometry (G-SRT)						
Understand similarity in te	Understand similarity in terms of similarity transformations continued					
<u>Standards</u>	<u>Label</u>	<u>Mathematical Practices</u>	Explanations and Examples

Geometry: Circles (G-C)						
Find arc lengths and areas	Find arc lengths and areas of sectors of circles					
Standards Students are expected to:	<u>Label</u>	<u>Mathematical Practices</u>	Explanations and Examples			
HS.G-C.5. Derive using similarity the fact that the length of the arc intercepted by an angle is proportional to the radius, and define the radian measure of the angle as the constant of proportionality; derive the formula for the area of a sector.  Connections: ETHS-S1C2-01; 11-12.RST.4	+	HS.MP.2 Reason abstractly and quantitatively.  HS.MP.3. Construct viable arguments and critique the reasoning of others.	Students can use geometric simulation software to explore angle and radian measures and derive the formula for the area of a sector.			

<b>Geometry: Expressing Geor</b>	netric P	roperties with Equations	(G-GPE)
Translate between the geor	netric d	escription and the equati	on for a conic section
<u>Standards</u>	<u>Label</u>	<b>Mathematical Practices</b>	Explanations and Examples
Students are expected to:			
HS.G-GPE.1. Derive the equation of a circle of given center and radius using the Pythagorean Theorem; complete the square to find the center and radius of a circle given by an equation.  Connections: ETHS-S1C2-01; 11-12.RST.4	*	HS.MP.7. Look for and make use of structure.  HS.MP.8. Look for and express regularity in repeated reasoning.	<ul> <li>Students may use geometric simulation software to explore the connection between circles and the Pythagorean Theorem.</li> <li>Examples:</li> <li>Write an equation for a circle with a radius of 2 units and center at (1, 3).</li> <li>Write an equation for a circle given that the endpoints of the diameter are (-2, 7) and (4, -8).</li> <li>Find the center and radius of the circle 4x² + 4y² - 4x + 2y - 1 = 0.</li> </ul>
HS.G-GPE.2. Derive the equation of a parabola given a focus and directrix.  Connections: ETHS-S1C2-01; 11-12.RST.4	+	HS.MP.7. Look for and make use of structure.  HS.MP.8. Look for and express regularity in repeated reasoning.	Students may use geometric simulation software to explore parabolas.  Examples:  • Write and graph an equation for a parabola with focus (2, 3) and directrix $y = 1$ .
HS.G-GPE.3. Derive the equations of ellipses and hyperbolas given the foci, using the fact that the sum or difference of distances from the foci is constant.  Connections: ETHS-S1C2-01; 11-12.RST.4	+	HS.MP.7. Look for and make use of structure. HS.MP.8. Look for and express regularity in repeated reasoning.	Students may use geometric simulation software to explore conic sections.  Example:  • Write an equation in standard form for an ellipse with foci at (0, 5) and (2, 0) and a center at the origin.

Geometry: Expressing Geon	netric Pi	roperties with Equations	(G-GPE)
Use coordinates to prove sin	mple ge	ometric theorems algebra	aically
Standards Students are expected to:	<u>Label</u>	Mathematical Practices	Explanations and Examples
HS.G-GPE.4. Use coordinates to prove simple geometric theorems algebraically. For example, prove or disprove that a figure defined by four given points in the coordinate plane is a rectangle; prove or disprove that the point (1, V3) lies on the circle centered at the origin and containing the point (0, 2).  Connections: ETHS-S1C2-01; 9-10.WHST.1a-1e;	9-10	HS.MP.3 Reason abstractly and quantitatively.	Students may use geometric simulation software to model figures and prove simple geometric theorems.  Example:  Use slope and distance formula to verify the polygon formed by connecting the points (-3, -2), (5, 3), (9, 9), (1, 4) is a parallelogram.
HS.G-GPE.5. Prove the slope criteria for parallel and perpendicular lines and use them to solve geometric problems (e.g., find the equation of a line parallel or perpendicular to a given line that passes through a given point).  Connection: 9-10.WHST.1a-1e	9-10	HS.MP.3. Construct viable arguments and critique the reasoning of others.  HS.MP.8. Look for and express regularity in repeated reasoning.	Lines can be horizontal, vertical, or neither.  Students may use a variety of different methods to construct a parallel or perpendicular line to a given line and calculate the slopes to compare the relationships.

Geometry: Expressing Geor	notric Dr	concretice with Equations	(C-CDF)
Use coordinates to prove si  Standards Students are expected to:	<u>Label</u>	Mathematical Practices	Explanations and Examples
HS.G-GPE.6. Find the point on a directed line segment between two given points that partitions the segment in a given ratio.  Connections: ETHS-S1C2-01; 9-10.RST.3	9-10	HS.MP.2. Reason abstractly and quantitatively.  HS.MP.8. Look for and express regularity in repeated reasoning.	Students may use geometric simulation software to model figures or line segments.  Examples:  Given A(3, 2) and B(6, 11),  Find the point that divides the line segment AB two-thirds of the way from A to B.  The point two-thirds of the way from A to B has x-coordinate two-thirds of the way from 3 to 6 and y coordinate two-thirds of the way from 2 to 11.  So, (5, 8) is the point that is two-thirds from point A to point B.  Find the midpoint of line segment AB.
HS.G-GPE.7. Use coordinates to compute perimeters of polygons and areas of triangles and rectangles, e.g., using the distance formula.  Connections: ETHS-S1C2-01; 9-10.RST.3; 11-12.RST.3	9-10 ★	HS.MP.2. Reason abstractly and quantitatively.  HS.MP.5. Use appropriate tools strategically.  HS.MP.6. Attend to precision.	Students may use geometric simulation software to model figures.

Geometry: Geometric Meas	urement	and Dimension (G-GMD)	
Explain volume formulas an	nd use th	em to solve problems	
Standards Students are expected to:	<u>Label</u>	<u>Mathematical Practices</u>	Explanations and Examples
HS.G-GMD.1. Give an informal argument for the formulas for the circumference of a circle, area of a circle, volume of a cylinder, pyramid, and cone. Use dissection arguments, Cavalieri's principle, and informal limit arguments.  Connections: 9-10.RST.4; 9-10.WHST.1e; 11-12.RST.4; 11-12.WHST.1c; 11-12.WHST.1e	9-10	HS.MP.3. Construct viable arguments and critique the reasoning of others.  HS.MP.4. Model with mathematics.  HS.MP.5. Use appropriate tools strategically.	Cavalieri's principle is if two solids have the same height and the same cross-sectional area at every level, then they have the same volume.
HS.G-GMD.2. Give an informal argument using Cavalieri's principle for the formulas for the volume of a sphere and other solid figures.  Connections: 9-10.RST.4; 9-10.WHST.1c; 11-12.RST.4; 11-12.WHST.1c; 11-12.WHST.1e	+	HS.MP.3. Construct viable arguments and critique the reasoning of others.  HS.MP.4. Model with mathematics.  HS.MP.5. Use appropriate tools strategically.	Cavalieri's principle is if two solids have the same height and the same cross-sectional area at every level, then they have the same volume.
HS.G-GMD.3. Use volume formulas for cylinders, pyramids, cones, and spheres to solve problems.  Connection: 9-10.RST.4	9-10 ★	HS.MP.1. Make sense of problems and persevere in solving them. HS.MP.2. Reason abstractly and quantitatively.	Missing measures can include but are not limited to slant height, altitude, height, diagonal of a prism, edge length, and radius.

Geometry: Geometric Measure Visualize relationships between Standards			
HS.G-GMD.4. Identify the shapes of two-dimensional cross-sections of three-dimensional objects, and identify three-dimensional objects generated by rotations of two-dimensional objects.  Connection: ETHS-S1C2-01	9-10	HS.MP.4. Model with mathematics. HS.MP.5. Use appropriate tools strategically.	Students may use geometric simulation software to model figures and create cross sectional views.  Example:  • Identify the shape of the vertical, horizontal, and other cross sections of a cylinder.

# **High School: Statistics and Probability Overview**

#### Interpreting Categorical and Quantitative Data (S-ID)

- Summarize, represent, and interpret data on a single count or measurement variable
- Summarize, represent, and interpret data on two categorical and quantitative variables
- Interpret linear models

#### Making Inferences and Justifying Conclusions (S-IC)

- Understand and evaluate random processes underlying statistical experiments
- Make inferences and justify conclusions from sample surveys, experiments and observational studies

#### Conditional Probability and the Rules of Probability (S-CP)

- Understand independence and conditional probability and use them to interpret data
- Use the rules of probability to compute probabilities of compound events in a uniform probability model

### Using Probability to Make Decisions (S-MD)

- Calculate expected values and use them to solve problems
- Use probability to evaluate outcomes of decisions

#### Mathematical Practices (MP)

- Make sense of problems and persevere in solving them.
- Reason abstractly and quantitatively. 2.
- Construct viable arguments and critique the reasoning of others.
- Model with mathematics.
- Use appropriate tools strategically.
- Attend to precision.
- Look for and make use of structure.
- Look for and express regularity in repeated reasoning.

# High School: Mathematics Standards – Mathematical Practices – Explanations and Examples

## Statistics and Probability ★

Decisions or predictions are often based on data—numbers in context. These decisions or predictions would be easy if the data always sent a clear message, but the message is often obscured by variability. Statistics provides tools for describing variability in data and for making informed decisions that take it into account.

Data are gathered, displayed, summarized, examined, and interpreted to discover patterns and deviations from patterns. Quantitative data can be described in terms of key characteristics: measures of shape, center, and spread. The shape of a data distribution might be described as symmetric, skewed, flat, or bell shaped, and it might be summarized by a statistic measuring center (such as mean or median) and a statistic measuring spread (such as standard deviation or interguartile range). Different distributions can be compared numerically using these statistics or compared visually using plots. Knowledge of center and spread are not enough to describe a distribution. Which statistics to compare, which plots to use, and what the results of a comparison might mean, depend on the question to be investigated and the real-life actions to be taken.

Randomization has two important uses in drawing statistical conclusions. First, collecting data from a random sample of a population makes it possible to draw valid conclusions about the whole population, taking variability into account. Second, randomly assigning individuals to different treatments allows a fair comparison of the effectiveness of those treatments. A statistically significant outcome is one that is unlikely to be due to chance alone, and this can be evaluated only under the condition of randomness. The conditions under which data are collected are important in drawing conclusions from the data; in critically reviewing uses of statistics in public media and other reports, it is important to consider the study design, how the data were gathered, and the analyses employed as well as the data summaries and the conclusions drawn.

Random processes can be described mathematically by using a probability model: a list or description of the possible outcomes (the sample space), each of which is assigned a probability. In situations such as flipping a coin, rolling a number cube, or drawing a card, it might be reasonable to assume various outcomes are equally likely. In a probability model, sample points represent outcomes and combine to make up events; probabilities of events can be computed by applying the Addition and Multiplication Rules. Interpreting these probabilities relies on an understanding of independence and conditional probability, which can be approached through the analysis of two-way tables.

Technology plays an important role in statistics and probability by making it possible to generate plots, regression functions, and correlation coefficients, and to simulate many possible outcomes in a short amount of time.

#### **Connections to Functions and Modeling**

Functions may be used to describe data; if the data suggest a linear relationship, the relationship can be modeled with a regression line, and its strength and direction can be expressed through a correlation coefficient.

Statistics and Probability: I	nterpret	ing Categorical and Quan	titative Data★ (S-ID)
Summarize, represent, and	interpr	et data on a single count o	r measurement variable

Use given functions or chooses a function suggested by the context. Emphasize linear, quadratic, and exponential models.  Connection: 11-12.RST.7		HS.MP.2. Reason abstractly and quantitatively.  HS.MP.3. Construct viable arguments and critique the reasoning of others.  HS.MP.4. Model with mathematics.  HS.MP.5. Use appropriate tools strategically.  HS.MP.7. Look for and make use of structure.  HS.MP.8. Look for and express regularity in repeated reasoning.	The residual in a regression model is the difference between the observed and the predicted $\mathcal Y$ for some $x(\mathcal Y)$ the dependent variable and $x$ the independent variable). So if we have a model $y=ax+b$ , and a data point $(x_i,y_i)$ the residual is for this point is: $r_i=y_i-(ax_i+b)$ . Students may use spreadsheets, graphing calculators, and statistical software to represent data, describe how the variables are related, fit functions to data, perform regressions, and calculate residuals. Example:  • Measure the wrist and neck size of each person in your class and make a scatterplot. Find the least squares regression line. Calculate and interpret the correlation coefficient for this linear regression model. Graph the residuals and evaluate the fit of the linear equations.

Statistics and Probability: N	Making I	nferences and Justifying (	Conclusions * (S-IC)
Make inferences and justify	conclus	sions from sample survey	s, experiments, and observational studies
Standards Students are expected to:	<u>Label</u>	<u>Mathematical Practices</u>	Explanations and Examples
HS.S-IC.3. Recognize the purposes of and differences among sample surveys, experiments, and observational studies; explain how randomization relates to each.  Connections: 11-12.RST.9; 11-12.WHST.2b	*	HS.MP.3. Construct viable arguments and critique the reasoning of others.  HS.MP.4. Model with mathematics.  HS.MP.6. Attend to precision.	Students should be able to explain techniques/applications for randomly selecting study subjects from a population and how those techniques/applications differ from those used to randomly assign existing subjects to control groups or experimental groups in a statistical experiment.  In statistics, an observational study draws inferences about the possible effect of a treatment on subjects, where the assignment of subjects into a treated group versus a control group is outside the control of the investigator (for example, observing data on academic achievement and socioeconomic status to see if there is a relationship between them). This is in contrast to controlled experiments, such as randomized controlled trials, where each subject is randomly assigned to a treated group or a control group before the start of the treatment.
HS.S-IC.4. Use data from a sample survey to estimate a population mean or proportion; develop a margin of error through the use of simulation models for random sampling.  Connections: ETHS-S6C2-03; 11-12.RST.9; 11-12.WHST.1e	+ *	HS.MP.1. Make sense of problems and persevere in solving them.  HS.MP.4. Model with mathematics.  HS.MP.5. Use appropriate tools strategically.	Students may use computer generated simulation models based upon sample surveys results to estimate population statistics and margins of error.
HS.S-IC.5. Use data from a randomized experiment to compare two treatments; use simulations to decide if differences between parameters are significant.  Connections: ETHS-S6C2-03; 11-12.RST.4; 11-12.RST.5; 11-12.WHST.1e	*	HS.MP.1. Make sense of problems and persevere in solving them.  HS.MP.4. Model with mathematics.  HS.MP.5. Use appropriate tools strategically.  HS.MP.8. Look for and express regularity in repeated reasoning.	Students may use computer generated simulation models to decide how likely it is that observed differences in a randomized experiment are due to chance.  Treatment is a term used in the context of an experimental design to refer to any prescribed combination of values of explanatory variables. For example, one wants to determine the effectiveness of weed killer. Two equal parcels of land in a neighborhood are treated; one with a placebo and one with weed killer to determine whether there is a significant difference in effectiveness in eliminating weeds.

- Model with mathematics.
- Use appropriate tools strategically.
- Attend to precision.
- 7. Look for and make use of structure.
- Look for and express regularity in repeated reasoning.

# High School: Contemporary Mathematics ★

Discrete mathematics is contemporary mathematics. This area of mathematics is very relevant in today's technologically advanced society. Discrete mathematics provides the underpinnings for many features of the Internet, from encryption of credit card numbers to decompression and compression of photographs, music, and video. It also informs the efficiency of our communication and transportation systems, such as determining the shortest path through a network or identifying the most cost effective design of airline or bus routes. The power of discrete mathematics is exemplified through the motivational impact on students. They are not only immersed in interesting mathematics but are actively engaged in the "doing" of mathematics. Mathematics is not a bystander sport.

Discrete mathematics topics, particularly vertex-edge graphs, afford students the opportunity to access problem solving in a meaningful context. Students strengthen their skills in problem solving, reasoning, conjecturing, communication, analysis, and proof. They apply the Standards for Mathematical Practice as they solve discrete mathematics problems. Discrete mathematics courses play an increasingly important role in the high school curriculum as possible pathways for those students who seek meaningful 4<sup>th</sup> credit courses that connect to technology and the needs of the 21<sup>st</sup> century learner.

Graph theory is the formal study of vertex-edge graphs. Unlike graphs used in data analysis, vertex-edge graphs are used to visually represent problem situations. Vertex-edge graphs are used to model and solve problems related to paths, circuits, or the relationship among a set of objects.

### Connections to Modeling

Mathematical modeling occurs when students follow a multistep process of solving problems and represent the key ideas through a visual representation. These visual representations allow students multiple entry points for solving a problem, ensuring material that is both engaging and accessible. Examples of real word situations that could be modeled using a vertex-edge graph are 1) planning a table tennis tournament for 7 players at a club with 4 tables, where each player plays against each other player or 2) engaging in critical path analysis, e.g., applied to turnaround of an aircraft at an airport.

Standards for Mathematical Practice (MP)					
<u>Standards</u> Students are expected to:	Mathematical Practices are listed throughout the grade level document in the 2nd column to reflect the need to connect the mathematical practices to mathematical content in instruction.	Explanations and Examples			
<b>HS.MP.1.</b> Make sense of problems and persevere in solving them.		High school students start to examine problems by explaining to themselves the meaning of a problem and looking for entry points to its solution. They analyze givens, constraints, relationships, and goals. They make conjectures about the form and meaning of the solution and plan a solution pathway rather than simply jumping into a solution attempt. They consider analogous problems, and try special cases and simpler forms of the original problem in order to gain insight into its solution. They monitor and evaluate their progress and change course if necessary. Older students might, depending on the context of the problem, transform algebraic expressions or change the viewing window on their graphing calculator to get the information they need. By high school, students can explain correspondences between equations, verbal descriptions, tables, and graphs or draw diagrams of important features and relationships, graph data, and search for regularity or trends. They check their answers to problems using different methods and continually ask themselves, "Does this make sense?" They can understand the approaches of others to solving complex problems and identify correspondences between different approaches.			
<b>HS.MP.2.</b> Reason abstractly and quantitatively.		High school students seek to make sense of quantities and their relationships in problem situations. They abstract a given situation and represent it symbolically, manipulate the representing symbols, and pause as needed during the manipulation process in order to probe into the referents for the symbols involved. Students use quantitative reasoning to create coherent representations of the problem at hand; consider the units involved; attend to the meaning of quantities, not just how to compute them; and know and flexibly use different properties of operations and objects.			
<b>HS.MP.3.</b> Construct viable arguments and critique the reasoning of others.		High school students understand and use stated assumptions, definitions, and previously established results in constructing arguments. They make conjectures and build a logical progression of statements to explore the truth of their conjectures. They are able to analyze situations by breaking them into cases, and can recognize and use counterexamples. They justify their conclusions, communicate them to others, and respond to the arguments of others. They reason inductively about data, making plausible arguments that take into account the context from which the data arose. High school students are also able to compare the effectiveness of two plausible arguments, distinguish correct logic or reasoning from that which is flawed, and—if there is a flaw in an argument—explain what it is. High school students learn to determine domains, to which an argument applies, listen or read the arguments of others, decide whether they make sense, and ask useful questions to clarify or improve the arguments.			

Standards for Mathematical Practice (MP) continued				
Standards Students are expected to:	Mathematical Practices are listed throughout the grade level document in the 2nd column to reflect the need to connect the mathematical practices to mathematical content in instruction.	Explanations and Examples		
<b>HS.MP.4.</b> Model with mathematics.		High school students can apply the mathematics they know to solve problems arising in everyday life, society, and the workplace. By high school, a student might use geometry to solve a design problem or use a function to describe how one quantity of interest depends on another. High school students making assumptions and approximations to simplify a complicated situation, realizing that these may need revision later. They are able to identify important quantities in a practical situation and map their relationships using such tools as diagrams, two-way tables, graphs, flowcharts and formulas. They can analyze those relationships mathematically to draw conclusions. They routinely interpret their mathematical results in the context of the situation and reflect on whether the results make sense, possibly improving the model if it has not served its purpose.		
<b>HS.MP.5.</b> Use appropriate tools strategically.		High school students consider the available tools when solving a mathematical problem. These tools might include pencil and paper, concrete models, a ruler, a protractor, a calculator, a spreadsheet, a computer algebra system, a statistical package, or dynamic geometry software. High school students should be sufficiently familiar with tools appropriate for their grade or course to make sound decisions about when each of these tools might be helpful, recognizing both the insight to be gained and their limitations. For example, high school students analyze graphs of functions and solutions generated using a graphing calculator. They detect possible errors by strategically using estimation and other mathematical knowledge. When making mathematical models, they know that technology can enable them to visualize the results of varying assumptions, explore consequences, and compare predictions with data. They are able to identify relevant external mathematical resources, such as digital content located on a website, and use them to pose or solve problems. They are able to use technological tools to explore and deepen their understanding of concepts.		
<b>HS.MP.6.</b> Attend to precision.		High school students try to communicate precisely to others by using clear definitions in discussion with others and in their own reasoning. They state the meaning of the symbols they choose, specifying units of measure, and labeling axes to clarify the correspondence with quantities in a problem. They calculate accurately and efficiently, express numerical answers with a degree of precision appropriate for the problem context. By the time they reach high school they have learned to examine claims and make explicit use of definitions.		

Standards for Mathematical Practice (MP) continued					
Standards Students are expected to:	Mathematical Practices are listed throughout the grade level document in the 2nd column to reflect the need to connect the mathematical practices to mathematical content in instruction.	Explanations and Examples			
<b>HS.MP.7.</b> Look for and make use of structure.		By high school, students look closely to discern a pattern or structure. In the expression $x^2 + 9x + 14$ , older students can see the 14 as 2 × 7 and the 9 as 2 + 7. They recognize the significance of an existing line in a geometric figure and can use the strategy of drawing an auxiliary line for solving problems. They also can step back for an overview and shift perspective. They can see complicated things, such as some algebraic expressions, as single objects or as being composed of several objects. For example, they can see $5 - 3(x - y)2$ as 5 minus a positive number times a square and use that to realize that its value cannot be more than 5 for any real numbers $x$ and $y$ . High school students use these patterns to create equivalent expressions, factor and solve equations, and compose functions, and transform figures.			
HS.MP.8. Look for and express regularity in repeated reasoning.		High school students notice if calculations are repeated, and look both for general methods and for shortcuts. Noticing the regularity in the way terms cancel when expanding $(x-1)(x+1)$ , $(x-1)(x^2+x+1)$ , and $(x-1)(x^3+x^2+x+1)$ might lead them to the general formula for the sum of a geometric series. As they work to solve a problem, derive formulas or make generalizations, high school students maintain oversight of the process, while attending to the details. They continually evaluate the reasonableness of their intermediate results.
